Introduction

WELCOME TO THE NLP CAPSTONE PROJECT!

Great job getting to this Capstone task! This Capstone Project is going to allow us to work with spaCy and functions to build a recommendation system for books.

NATURAL LANGUAGE PROCESSING APPLICATIONS

Language Translation

The volume of information being put up online is growing more than ever. The thirst for data is also increasing as the paradigm of software engineering is increasingly proving to be very important in our daily lives. Language translation helps us conquer language barriers that we often encounter by translating technical manuals, support content or websites at a significantly reduced cost and at a very high rate. The challenge with language translation technologies is not in translating words, but in understanding the meaning of sentences to provide a true translation. For example, we have movies that are Spanish or Korean and we are able to watch them without knowing these languages.

Text classification

One of the applications of NLP that we experience on a daily basis is the text classification in our email folders: by using predefined categories, we can organise our spam folders and inbox so that we can access relevant emails or messages more efficiently.

Automatic summarisation

When working with huge amounts of information (like articles, books and websites), it can be extremely useful to be able to shorten these pieces into condensed forms that only show the pieces of information that are most useful to you. This is what automatic summarisation is about. According to Expert System (2020): "Automatic summarization is relevant not only for summarizing the meaning of documents and information, but also for understand[ing] the emotional meanings inside the information, such as in collecting data from social media."

Sentiment analysis

Similarly to how we can infer someone's meaning from their tone, sentiment analysis allows us to detect the emotion behind a piece of text using NLP. This is particularly useful for large companies who want to know what the general sentiment of their company is. By analysing articles and write-ups about their company, they can gain a fairly accurate idea of how people feel about them based on the language used when they are discussed.

Question Answering

This is an application of NLP that has come a long way in a short space of time. Simply put, these systems allow a computer to answer a question posed by a human. Siri and Okay Google are well-known voice-based question answering systems, but text-based systems can now be seen on almost every banking or online shopping site in the form of a chatbox.

Compulsory Task 1

- In a file called **nlp_1.pdf**, categorise which type of NLP application applies for each of the following use-cases:
(Use the categories we have discussed on this bootcamp so far)
 - a. A model that allocates which mail folder an email should be sent to (work, friends, promotions, important), like Gmail's inbox tabs.
 - b. A model that helps decide what grade to award to an essay question. This can be used by a university professor who grades a lot of classes or essay competitions.
 - c. A model that provides assistive technology for doctors to provide their diagnosis. Remember, doctors ask questions, so the model will use the patients' answers to provide probable diagnosis for the doctor to weigh and make decisions.

Compulsory Task 2

- Read up on any innovative technology using NLP (by companies such as Google or IBM, for instance) and write a brief summary about the technology, what it achieves/does, and an overview of how it works (250 - 500 words).

To take an example, you may have noticed Gmail's auto-response suggestions on your incoming emails. If I send an email to your Gmail address asking for an appointment, on opening the mail you would notice Gmail's automatically suggested response options such as "Yes, that works for me" and "Sorry, I'm not available at that time."

- Save your answer in a file called **nlp_2.pdf**.
